

Honeycomb Polypropylene Cases

CP Cases constantly seeks new materials and processes to develop and enhance the product range, pioneering innovative solutions to protective packaging problems

Lightweight HPP Cases

CP Cases continually searches for innovative materials and processes to enable us to offer our customers as many opportunities as possible to solve their transit packaging problems.

CP now offers an alternative to conventional materials for flight cases where both weight and strength are considerations.

Honeycomb Polypropylene (HPP)

- Weighs 40% less than its equivalent in wood
- Polypropylene “honeycomb” sandwich construction for added strength
- Suitable for cases with lightweight applications
- Available in 6 mm and 9 mm thicknesses
- Available in blue, black and red

HPP is particularly suited to lightweight applications in electronics, test & measurement, and medical industries.

Manufactured using CP Cases’ established construction methods, cases made with HPP combine exceptional strength with what is often a significant weight advantage.

HPP can be used to create ultra-lightweight 19-inch electronic racks such as our innovative SatRack, weighing just 9 kg for a 4U rack.

SatRack, CP Cases’ unique, super-lightweight transit rack solution has a body shell made of thermo-formed 10 mm HPP for strength and rigidity.
